

## WinDSX Version 3 Upgrade

This Software update improves the quality of the images captured using the FlashBus Capture card. Our records indicate that your company recently purchased a FlashBus video capture card so we are sending you this update automatically to provide you with the improvement. Below are the steps necessary to update your software and make adjustments to your image source. Making these changes will drastically improve the image quality of your system.

This update must be performed on all PCs running WinDSX in the system. Close the program on all PCs before starting.

1. For Software Updates, first make a backup under System/Setup in the DataBase program. Next the program must be exited on all PCs including the Comm Server.
2. If this system is using a Dedicated File Server the software must be un-installed and re-installed on the File Server first. If the system is configured to use one of the Workstations as the Shared DataBase resource then this PC should be the first one updated.

### Un-Installing WinDSX

3. To un-install WinDSX select "Start" then "Settings" then "Control Panel". From "Control Panel" select "Add/Remove Programs". Select "WinDSX" and then click on "Remove". When prompted to "Remove Shared Files" select "Remove All" if you are going to re-install WinDSX. If WinDSX is not to be re-installed select "Remove None". If the un-install program

states that certain \*.zip, and \*.mdb files cannot be removed because they no longer exist just Click on OK and continue. This is normal and nothing to worry about. When the program is removed the directory and the database will still be intact and in the same location.

### Re-Installing WinDSX

4. Once the software is un-installed on the server it is ready to be re-installed. To load the software, place the WinDSX CD in the CD-ROM Drive. Select "My Computer" on the desktop then right click on the CD-ROM Drive and select explore. Navigate to the Install Directory. Open the Install Directory and double click on Setup.exe. Follow the prompts and allow setup to install the software into the C:\WinDSX directory or instruct setup of the desired directory.

**Note///** The first time WinDSX 2.1 or higher is loaded the setup program will prompt you to update some system files and then it will be necessary to reboot the PC. After the PC restarts run the Setup program again.

5. When the software is loaded on the File Server, use Explorer to locate and run the DB.EXE program located in the same directory on the server. Once the DB.EXE program is finished updating the database it will leave you on the DataBase Main Menu. Select File then Exit.
6. Repeat steps 3 and 4 above for all Workstations and the Comm Server that runs the WinDSX program.

### Changes for the Badging PC

7. In the WinDSX Database program navigate to System/Setup/Image Source. Double click on the name of the Live Video Source.
8. Select the Commands Tab of the video source. Scroll to the bottom of the screen and click on the "Default Commands" button, then click on "OK". Close and restart the program.
